

RS7LS304 140Mb/s Bi-directional Level Translator for Push-Pull Applications

Features

- Qualified for Automotive Applications
- 1.65V to 3.6V on A Port and 1.65V to 3.6V on B Port
- VCCA may be greater than, equal to, or less than VCCB
- High-Speed with 140 Mb/s Guaranteed Date Rate
- 100 pF Capacitive Drive Capability
- Low Bit-to-Bit Skew
- Overvoltage Tolerant Enable and I/O Pins
- Non-preferential Power-Up Sequencing
- Power-Off Protection
- ESD protection exceeds 4000V HBM
- Extended Temperature: -40°C to +85°C

Applications

- Automotive
- Cell phone, Tablet, PC
- Server, Telecommunication

Block Diagram

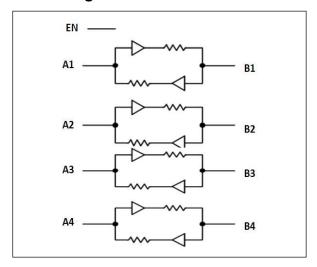

Figure 1 : Block Diagram

Description

The RS7LS304 is an automotive qualified 4-bit configurable dual-supply autosensing bidirectional level translator that does not require a direction control pin. The B and A ports are designed to track two different power supply rails, VCCB and VCCA respectively.

The RS7LS304 offers the feature that the values of the VCCB and VCCA supplies are independent. Design flexibility is maximized because VCCA can be set to a value either greater than or less than the VCCB supply.

The RS7LS304 has high output current capability, which allows the translator to drive high capacitive loads such as most high frequency EMI filters. Another feature of the RS7LS304 is that each An and Bn channel can function as either an input or an output.

An Output Enable (EN) input is available to reduce the power consumption. The EN pin can be used to disable both I/O ports by putting them in 3-state which significantly reduces the supply current.

Ordering Information:

Note

- 1. Normal test conditions are $V_I = 0V$, $C_{IOB} \le 15 pF$ and $C_{IOA} \le 15 pF$, unless otherwise specified.
- 2. V_{CCB} is the supply voltage associated with the I/O B port, and B range from +1.65 V to 3.6 V under normal operating conditions.
- 3. V_{CCA} is the supply voltage associated with the I/O A port, and A range from +1.2 V to 2.0 V under normal operating conditions.
- 4. Typical values are for V_{CCB} = +2.8V, V_{CCA} = +1.8V and T_A = +25°C. All units are production tested at T_A = +25°C. Limits over the operating temperature range are guaranteed by design.
- 5. When VCCA <1.0V, VIH is 0.75*V_{CCA} (Min), VIL is 0.25*V_{CCA} (Max)

Functional Description

The RS7LS304 is a 4-bit configurable dual-supply autosensing bidirectional level translator that does not require a direction control pin. The B and A ports are designed to track two different power supply rails, VCCB and VCCA respectively.

The RS7LS304 offers the feature that the values of the VCCB and V_{CCA} supplies are independent. Design flexibility is maximized because VCCA can be set to a value either greater than or less than the VCCB supply.

The RS7LS304 has high output current capability, which allows the translator to drive high capacitive loads such as most high frequency EMI filters. Another feature of the RS7LS304 is that each An and Bn channel can function as either an input or an output.

An Output Enable (EN) input is available to reduce the power consumption. The EN pin can be used to disable both I/O ports by putting them in 3-state which significantly reduces the supply current.

Application Information

Level Translator Architecture

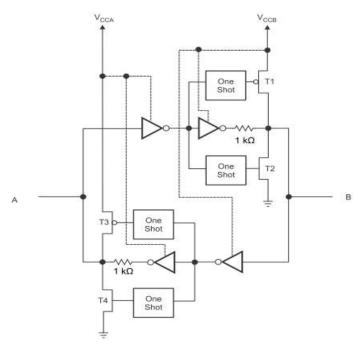

Figure 7: Architecture

The RS7LS304 auto-sense translator provides bi-directional logic voltage level shifting to transfer data in multiple supply voltage systems. These level translators have two supply voltages, V_{CCA} and V_{CCB} , which set the logic levels on the input and output sides of the translator. When used to transfer data from the I/O V_{CCA} to the I/O V_{CCB} ports, input signals referenced to the V_{CCA} supply are translated to output signals with a logic level matched to VCCB. In a similar manner, the I/O V_{CCB} to I/O V_{CCA} translation shifts input signals with a logic level compatible to V_{CCB} to an output signal matched to V_{CCA} . The RS7LS304 translator consists of bi-directional channels that independently determine the direction of the data flow without requiring a directional pin. One-shot circuits are used to detect the rising or falling input signals. In addition, the one-shots decrease the rise and fall times of the output signal for high-to-low and low-to-high transitions.

Input Driver Requirements

Auto-sense translators such as the RS7LS304 have a wide bandwidth, but a relatively small DC output current rating. The high bandwidth of the bi-directional I/O circuit is used to quickly transform from an input to an output driver and vice versa. The I/O ports have a modest DC current output specification so that the output driver can be over driven when data is sent in the opposite direction. For proper operation, the input driver to the auto-sense translator should be capable of driving 3mA of peak output current. The bi-directional configuration of the translator results in both input stages being active for a very short time period. Although the peak current from the input signal circuit is relatively large, the average current is small and consistent with a standard CMOS input stage.

Enable Input (EN)

The RS7LS304 translator has an Enable pin (EN) that provides tri-state operation at the I/O pins. Driving the Enable pin to a low logic level minimizes the power consumption of the device and drives the I/O V_{CCB} and I/O V_{CCA} pins to a high impedance state. Normal translation operation occurs when the EN pin is equal to a logic high signal. The EN pin is referenced to the V_{CCA} supply and has Over-Voltage Tolerant (OVT) protection.

Uni-Directional versus Bi-Directional Translation

The RS7LS304 translator can function as a non-inverting uni-directional translator. One advantage of using the translator as a uni-directional device is that each I/O pin can be configured as either an input or output. The configurable input or output feature is especially useful in applications such as SPI that use multiple uni-directional I/O lines to send data to and from a device. The flexible I/O port of the auto sense translator simplifies the trace connections on the PCB.

Power Supply Guidelines

The values of the V_{CCA} and V_{CCB} supplies can be set to anywhere in range 1.65-3.6V and 1.65-3.6V. Design flexibility is maximized because V_{CCA} may be either greater than or less than the V_{CCB} supply. In contrast, the majority of the competitive auto sense translators has a restriction that the value of the V_{CCA} supply must be equal to less than (V_{CCB} -0.4) V. The sequencing of the power supplies will not damage the device during power-up operation. In addition, the I/O V_{CCB} and I/O V_{CCA} pins are in the high impedance state if either supply voltage is equal to 0V. For optimal performance, 0.01 to 0.1µF decoupling capacitors should be used on the V_{CCA} and V_{CCB} power supply pins. Ceramic capacitors are a good design choice to filter and bypass any noise signals on the voltage lines to the ground plane of the PCB. The noise immunity will be maximized by placing the capacitors as close as possible to the supply and ground pins, along with minimizing the PCB connection traces.

The RS7LS304 translators have a power down feature that provides design flexibility. The output ports are disabled when either power supply is off (V_{CCA} or $V_{CCB} = 0V$). This feature causes all of the I/O pins to be in the power saving high impedance state.
