

Features

- No Direction-Control
- Max Data Rates
24Mbps (Push-Pull, 12MHz)
2Mbps (Open-Drain, 1MHz)
- 1.2V to 3.63V on A ports and 1.2V to 3.63V on B Ports
- VCCA can be Less than, Greater than or Equal to VCCB
- VCC Isolation: If Either VCC is at GND, Both Ports are in the High-Impedance State
- No Power-Supply Sequencing Required: VCCA or VCCB can be Ramped First
- ESD protection exceeds 4000V HBM
- Extended Temperature: -40°C to +125°C

Applications

- I2C/SMBus, MDIO, SPI Interface
- Low-Voltage ASIC Level Translation
- Cell phone, Tablet, PC
- Server, Telecommunication

Block Diagram

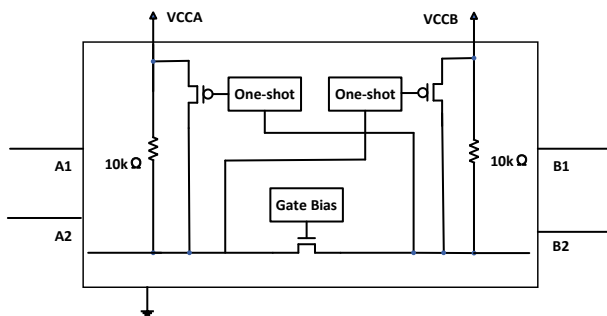

Figure 1: Block Diagram

Description

The RS7LS102 is a 2-bit configurable dual supply bidirectional auto sensing translator that does not require a directional control pin. The A and B ports are designed to track two different power supply rails, VCCA and VCCB respectively.

A port supporting operating voltages from 1.2V to 3.63V while it tracks the VCCA supply, and the B ports supporting operating voltages from 1.2V to 3.63V while it tracks the VCCB supply. This allows the support of both lower and higher logic signal levels while providing bidirectional translation capabilities between any of the 1.2V, 1.8V, 2.5V, and 3.3V voltage nodes.

The translator has integrated 10 kΩ pull-up resistors on the I/O lines. The integrated pull-up resistors are used to pull-up the I/O lines to either VCCA or VCCB. The RS7LS102 is an excellent match for open-drain applications such as the I2C communication bus.

When the output-enable (EN) input is low, all outputs are placed in the high-impedance state. To ensure the high-impedance state during power up or power down, EN should be tied to GND through a pulldown resistor; the minimum value of the resistor is determined by the current-sourcing capability of the driver.

Ordering Information

| Ordering Code | Package | Package Description |
|---------------|---------|---------------------|
| RS7LS102ZEE | ZE | TDFN-8L, 2.0x3.0 mm |
| RS7LS102TE | T | SOT23-8L, 2.9X1.6mm |

Notes:

E = Pb-free and Green

| Ishort | Short circuit duration (I/O to GND) | | | 50 | mA |

Notes:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Figure 4 Load Circuit for Enable-Time and Disable-Time Measurement

Notes:

1. C_L includes probe and jig capacitance.
2. t_{en} is the same as t_{PZL} and t_{PZH} . t_{dis} is the same as t_{PLZ} and t_{PHZ} .
3. V_{CCI} is the supply voltage associated with the input.
4. V_{CCO} is the supply voltage associated with the output.

Voltage Waveforms

The outputs are measured one at a time, with one transition per measurement. All input pulses are supplied by generators that have the following characteristics:

PRR ≤ 10 MHz

$Z_O = 50 \Omega$

$dv/dt \geq 1$ V/ns

Figure 5 Pulse Duration

Figure 6 Propagation Delay Times

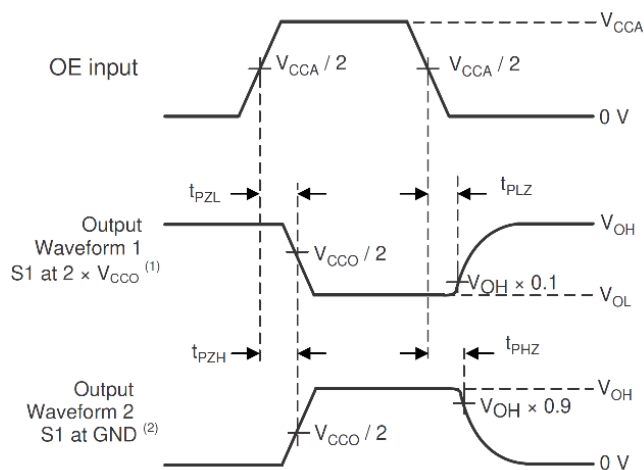

Figure 7 Enable and Disable Times

1. Waveform 1 is for an output with internal such that the output is high, except when OE is high.
2. Waveform 2 is for an output with conditions such that the output is low, except when OE is high.

Functional Description

The RS7LS102 is a 4-bit configurable dual-supply bidirectional auto sensing translator that does not require a directional control pin. The A and B ports are designed to track two different power supply rails, V_{CCA} and V_{CCB} respectively.

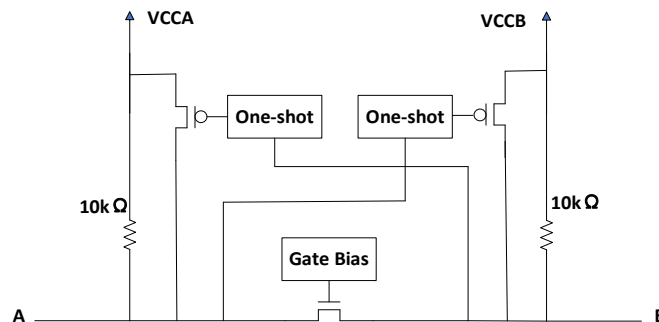

Figure 8 Level Shifter Architecture

Each A-port I/O has an internal 10kΩ pull up resistor to V_{CCA} , and each B-port I/O has an internal 10kΩ pull-up resistor to V_{CCB} . The output one-shots detect rising edges on the A or B ports. During a rising edge, the one-shot turns on the PMOS transistors for a short duration, which speeds up the low-to-high transition.

Input Driver Requirements

The rise (t_R) and fall (t_F) timing parameters of the open drain outputs depend on the magnitude of the pull-up resistors. In addition, the propagation times (t_{PD}), skew (t_{SKEW}) and maximum data rate depend on the impedance of the device that is connected to the translator. The timing parameters listed in the data sheet assume that the output impedance of the drivers connected to the translator is less than 50 kΩ.

Enable Input (OE)

The RS7LS102 has an Enable pin (OE) that provides tri-state operation at the I/O pins. Driving the Enable pin to a low logic level minimizes the power consumption of the device and drives the I/O V_{CCB} and I/O V_{CCA} pins to a high impedance state. Normal translation operation occurs when the OE pin is equal to a logic high signal. The OE pin is referenced to the V_{CCA} supply and has overvoltage tolerant protection.

Application Information

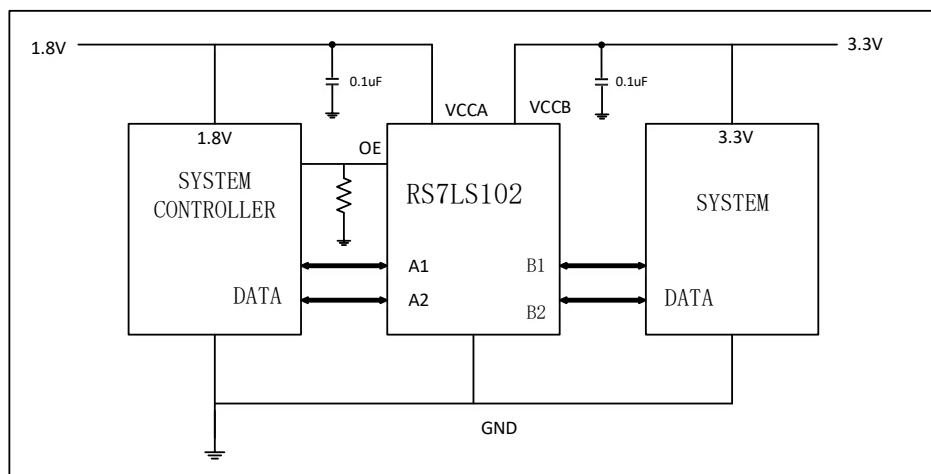

Figure 10 Application Circuit

Power Supply Guidelines

During normal operation, supply voltage VCCA can be greater than, less than or equal to VCCB. The sequencing of the power supplies will not damage the device during the power up operation. For optimal performance, 0.01μF to 0.1μF decoupling capacitors should be used on the VCCA and VCCB power supply pins. Ceramic capacitors are a good design choice to filter and bypass any noise signals on the voltage lines to the ground plane of the PCB. The noise immunity will be maximized by placing the capacitors as close as possible to the supply and ground pins, along with minimizing the PCB connection traces.
