

Features

- No Direction-Control
- Max Data Rates
24Mbps (Push-Pull)
2Mbps (Open-Drain)
- 1.2V to 3.63V on A ports and 1.2V to 3.63V on B Ports
- VCCA can be Less than, Greater than or Equal to VCCB
- VCC Isolation: If Either VCC is at GND, Both Ports are in the High-Impedance State
- No Power-Supply Sequencing Required: VCCA or VCCB can be Ramped First
- ESD protection exceeds 6000V HBM, 1000V CDM
- AEC-Q100 qualified, PPAP capable, and manufactured in IATF 16949 certified facilities.
- Grade 1 temperature range (- 40°C ~ +125 °C)

Applications

- I2C/SMBus
- SPI Interface
- UART
- Handheld Devices Interface

Description

The RS7LS104Q is a 4-bit configurable dual supply bidirectional auto sensing translator that does not require a directional control pin. The A and B ports are designed to track two different power supply rails, VCCA and VCCB respectively.

A port supporting operating voltages from 1.2V to 3.63V while it tracks the VCCA supply, and the B ports supporting operating voltages from 1.2V to 3.63V while it tracks the VCCB supply. This allows the support of both lower and higher logic signal levels while providing bidirectional translation capabilities between any of the 1.2V, 1.8V, 2.5V, 3.3V voltage and 3.63V nodes.

When the output-enable (EN) input is low, all outputs are placed in the high-impedance state. To ensure the high-impedance state during power up or power down, EN should be tied to GND through a pulldown resistor; the minimum value of the resistor is determined by the current-sourcing capability of the driver.

Ordering Information

Ordering Code	Package	Description
RS7LS104QZME	ZM	UQFN-12, 1.7mmx2.0 mm
RS7LS104QLE	L	TSSOP-14, pitch 0.65mm

Absolute Maximum Ratings

Symbol	Parameter	MIN	TYP	MAX	Unit
Tstore	Storage Temperature	-65	-	150	°C
VCCA	DC Supply Voltage port B	-0.3	-	5.5	V
VCCB	DC Supply Voltage port A	-0.3	-	5.5	V
VIOB	Vi(A) referenced DC Input / Output Voltage	-0.3	-	5.5	V
VIOB	Vi(B) referenced DC Input / Output Voltage	-0.3	-	5.5	V
VEN	Enable Control Pin DC Input Voltage	-0.3	-	5.5	V
Ishort	Short circuit duration (I/O to GND)			50	mA

Notes:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Recommended operation conditions

Symbol	Parameter	MIN	TYP	MAX	Unit
VCCA	VCCA Positive DC Supply Voltage	1.2	-	3.63	V
VCCB	VCCB Positive DC Supply Voltage	1.2	-	3.63	V
VEN	Enable Control Pin Voltage	GND	-	3.63	V
VIO	I/O Pin Voltage	GND	-	3.63	V
$\Delta t / \Delta V$	Input transition rise or fall time	-	-	10	ns/V

tPHZ / TpzH	Open

Figure 5 Load Circuit for Enable-Time and Disable-Time Measurement

Notes:

1. CL includes probe and jig capacitance.
2. ten is the same as tPZL and tPZH. tdis is the same as tPLZ and tPHZ.
3. VccI is the supply voltage associated with the input.
4. Vcco is the supply voltage associated with the output.

Voltage Waveforms

The outputs are measured one at a time, with one transition per measurement. All input pulses are supplied by generators that have the following characteristics:

- $PRR \leq 10 \text{ MHz}$
- $Z_O = 50 \ \Omega$
- $dv/dt \geq 1 \text{ V/ns}$

Figure 6 Pulse Duration

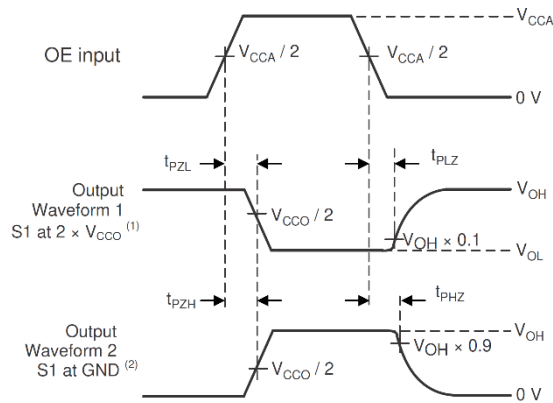

Figure 7 Propagation Delay Times

- A. Waveform 1 is for an output with internal such that the output is high, except when OE is high.
B. Waveform 2 is for an output with conditions such that the output is low, except when OE is high.

Figure 8 Enable and Disable Times

Functional Description

Architecture

The RS7LS104Q architecture does not require a direction-control signal in order to control the direction of data flow from A to B or from B to A.

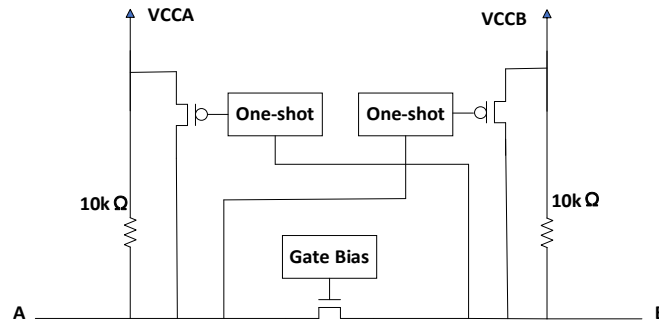

Figure 9 Level Shifter Architecture

Each A-port I/O has an internal 10kΩ pull up resistor to V_{CCA} , and each B-port I/O has an internal 10kΩ pull-up resistor to V_{CCB} . The output one-shots detect rising edges on the A or B ports. During a rising edge, the one-shot turns on the PMOS transistors for a short duration, which speeds up the low-to-high transition.

Input Driver Requirements

The rise (t_R) and fall (t_F) timing parameters of the open drain outputs depend on the magnitude of the pull-up resistors. In addition, the propagation times (t_{PD}), skew (t_{SKEW}) and maximum data rate depend on the impedance of the device that is connected to the translator. The timing parameters listed in the data sheet assume that the output impedance of the drivers connected to the translator is less than 50 kΩ .

Enable Input (OE)

The RS7LS104Q has an Enable pin (OE) that provides tri-state operation at the I/O pins. Driving the Enable pin to a low logic level minimizes the power consumption of the device and drives the I/O V_{CCB} and I/O V_{CCA} pins to a high impedance state. Normal translation operation occurs when the OE pin is equal to a logic high signal. The OE pin is referenced to the V_{CCA} supply and has overvoltage tolerant protection.

Pull-up or Pull-down Resistors on I/O Lines

Each A-port I/O has an internal 10kΩ pull-up resistor to V_{CCA} , and each B-port I/O has an internal 10 kΩ pull-up resistor to V_{CCB} . If a smaller value of pull-up resistor is required, an external resistor must be added from the I/O to V_{CCA} or V_{CCB} (in parallel with the internal 10 kΩ resistors).

Device Functional Modes

The RS7LS104Q device has two functional modes, enabled and disabled. To disable the device set the OE input low, which places all I/Os in a high impedance state. Setting the OE input high will enable the device.

Application Information

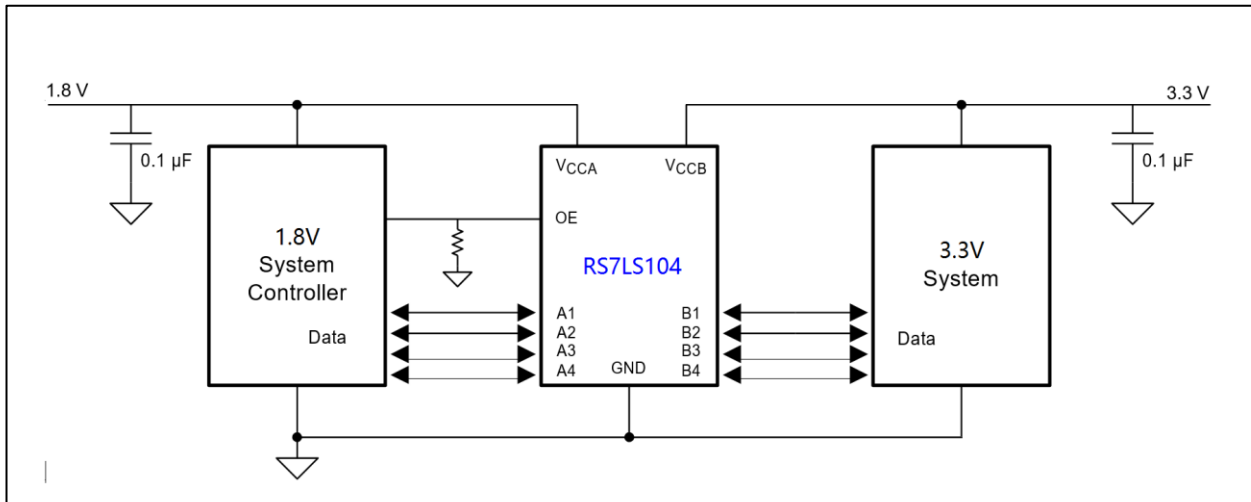

Figure 10 Application Circuit

Power Supply Guidelines

During normal operation, supply voltage V_{CCA} can be greater than, less than or equal to V_{CCB} . The sequencing of the power supplies will not damage the device during the power up operation. For optimal performance, $0.01\mu\text{F}$ to $0.1\mu\text{F}$ decoupling capacitors should be used on the V_{CCA} and V_{CCB} power supply pins. Ceramic capacitors are a good design choice to filter and bypass any noise signals on the voltage lines to the ground plane of the PCB. The noise immunity will be maximized by placing the capacitors as close as possible to the supply and ground pins, along with minimizing the PCB connection traces.
