

Features

- No Direction-Control
- Max Data Rates
24Mbps (Push-Pull, 12MHz)
1.2Mbps (Open-Drain, 0.6MHz)
- 1.1V to 5.5V on A ports and 1.1V to 5.5V on B Ports ($V_{CCA} \leq V_{CCB}$)
- VCC Isolation: If Either VCC is at GND, Both Ports are in the High-Impedance State
- No Power-Supply Sequencing Required: VCCA or VCCB can be Ramped First
- Ioff Supports Partial Power-Down-Mode Operation
- ESD protection exceeds 4000V HBM
- Extended Temperature: -40°C to +125°C

Application

- I2C/SMBus, MDIO, SPI Interface
- Low-Voltage ASIC Level Translation
- Cell phone, Tablet, PC
- Server, Telecommunication

Description

The RS7LSX102 is a 2-bit configurable dual supply bidirectional auto sensing translator that does not require a directional control pin. The A and B ports are designed to track two different power supply rails, VCCA and VCCB respectively.

A port supporting operating voltages from 1.1V to 5.5V while it tracks the VCCA supply, and the B ports supporting operating voltages from 1.1V to 5.5V while it tracks the VCCB supply. This allows the support of both lower and higher logic signal levels while providing bidirectional translation capabilities between any of the 1.2V, 1.8V, 2.5V, 3.3V and 5V voltage nodes

The translator has integrated pull-up resistors on the I/O lines. The integrated pull-up resistors are used to pull-up the I/O lines to either VCCA or VCCB. The RS7LSX102 is an excellent match for open-drain applications such as the I2C communication bus.

When the output-enable (EN) input is low, all outputs are placed in the high-impedance state. To ensure the high-impedance state during power up or power down, EN should be tied to GND through a pulldown resistor; the minimum value of the resistor is determined by the current-sourcing capability of the driver.

Ordering Information

Part Number	Package	Description
RS7LSX102V	VSSOP8	2.0mmx2.3mm
RS7LSX102ZE	DFN-8	2.0mmx3.0mm

Pin Configuration

Pin Name	Pin No. VSSOP8	Pin No. DFN8	Type	Description
VCCA	3	1	Power	B-port supply voltage. $1.1V \leq VCCA \leq 5.5V$
A1	5	2	I/O	Input/output A. Referenced to VCCB
A2	4	3	I/O	Input/output A. Referenced to VCCB
GND	2	4	GND	Ground.
OE	6	5	Input	Output enables (active High). Pull OE low to place all outputs in 3-state mode.
B2	1	6	I/O	Input/output A. Referenced to VCCA
B1	8	7	I/O	Input/output A. Referenced to VCCA.
VCCB	7	8	Power	A-port supply voltage. $1.1V \leq VCCB \leq 5.5V$

Absolute Maximum Ratings

Symbol	Parameter	MIN	TYP	MAX	Unit
Tstore	Storage Temperature	-65	-	+150	°C
VCCA	DC Supply Voltage port B	-0.3	-	6.5	V
VCCB	DC Supply Voltage port A	-0.3	-	6.5	V
VIOB	Vi(A) referenced DC Input / Output Voltage	-0.3	-	6.5	V
VIOB	Vi(B) referenced DC Input / Output Voltage	-0.3	-	6.5	V
VOE	Enable Control Pin DC Input Voltage	-0.3	-	6.5	V
Ishort	Short circuit duration (I/O to GND)			50	mA

Notes:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Recommended operation conditions

Symbol	Parameter	MIN	TYP	MAX	Unit
VCCA	VCCA Positive DC Supply Voltage	1.1	-	5.5	V
VCCB	VCCB Positive DC Supply Voltage	1.1	-	5.5	V
VOE	Enable Control Pin Voltage	GND	-	5.5	V
VIO	I/O Pin Voltage	GND	-	5.5	V
$\Delta t / \Delta V$	Input transition rise or fall time	-	-	10	ns/V
TA	Operating Temperature Range	-40	-	+125	°C

2. Waveform 2 is for an output with conditions such that the output is low, except when OE is high.

Functional Description

The RS7LSX102 device is a directionless voltage-level translator specifically designed for translating logic voltage levels. The A-port accepts I/O voltages ranging from 1.1 V to 5.5 V. The B-port accepts I/O voltages from 1.1 V to 5.5 V. The device uses pass gate architecture with edge rate accelerators (one shots) to improve the overall data rate. The pull-up resistors, commonly used in open-drain applications, have been conveniently integrated so that an external resistor is not needed. While this device is designed for open-drain applications, the device can also translate push-pull CMOS logic outputs.

Each A-port I/O has a pull-up resistor (RPUA) to VCCA and each B-port I/O has a pull-up resistor (RPUB) to VCCB. RPUA and RPUB have a value of 40 k Ω when the output is driving low. RPUA and RPUB have a value of 4 k Ω when the output is driving high. RPUA and RPUB are disabled when OE = Low.

Architecture

Figure 8 describes semi-buffered architecture design this application requires for both push-pull and open-drain mode. This application uses edge-rate accelerator circuitry (for both the high-to-low and low-to-high edges), a high-on-resistance N-channel pass-gate transistor (on the order of 300 Ω to 500 Ω) and pull-up resistors (to provide DC-bias and drive capabilities) to meet these requirements. This design needs no direction-control signal (to control the direction of data flow from A to B or from B to A). The resulting implementation supports both low-speed open-drain operation as well as high-speed push-pull operation.

Figure 8 Level Shifter Architecture

When transmitting data from A-ports to B-ports, during a rising edge the one-shot circuit (OS3) turns on the PMOS transistor (P2) for a short-duration which reduces the low-to-high transition time. Similarly, during a falling edge, when transmitting data from A to B, the one-shot circuit (OS4) turns on the N-channel MOSFET transistor (N2) for a short-duration which speeds up the high-to-low transition. The B-port edge-rate accelerator consists of one-shot circuits OS3 and OS4. Transistors P2 and N2 and serves to rapidly force the B port high or low when a corresponding transition is detected on the A port.

When transmitting data from B- to A-ports, during a rising edge the one-shot circuit (OS1) turns on the PMOS transistor (P1) for a short-duration which reduces the low-to-high transition time. Similarly, during a falling edge, when transmitting data from B to A, the one-shot circuit (OS2) turns on NMOS transistor (N1) for a short-duration and these speeds up the high-to-low transition. The A-port edge-rate accelerator consists of one-shots OS1 and OS2, transistors P1 and N1 components and form the edge-rate accelerator and serves to rapidly force the A port high or low when a corresponding transition is detected on the B port.

Input Driver Requirements

The continuous DC-current sinking capability is determined by the external system-level open-drain (or push- pull) drivers that are interfaced to the RS7LSX102 I/O pins. Because the high bandwidth of these bidirectional I/O circuits is used to facilitate this fast change from an input to an output and an output to an input, they have a modest DC-current sourcing capability of hundreds of micro-amperes, as determined by the internal pull-up resistors.

The fall time (t_{fA} , t_{fB}) of a signal depends on the edge-rate and output impedance of the external device driving RS7LSX102 data I/Os, as well as the capacitive loading on the data lines.

Similarly, the t_{PHL} and maximum data rates also depend on the output impedance of the external driver. The values for t_{fA} , t_{fB} , t_{PHL} , and maximum data rates in the data sheet assume that the output impedance of the external driver is less than 50 Ω .

Output Load Considerations

Raystar recommends careful PCB layout practices with short PCB trace lengths to avoid excessive capacitive loading and to ensure that proper one-shot triggering takes place. PCB signal trace-lengths should be kept short enough such that the round-trip delay of any reflection is less than the one-shot duration. This improves signal integrity by ensuring that any reflection sees a low impedance at the driver. The one-shot circuits have been designed to stay on for approximately 15 ns. The maximum capacitance of the lumped load that can be driven also depends directly on the one-shot duration. With very heavy capacitive loads, the one-shot can time-out before the signal is driven fully to the positive rail. The one-shot duration has been set to best optimize trade-offs between dynamic ICC, load driving capability, and maximum bit-rate considerations. Both PCB trace length and connectors add to the capacitance of the RS7LSX102 output. Therefore, Raystar recommends that this lumped-load capacitance is considered in order to avoid one-shot retriggering, bus contention, output signal oscillations, or other adverse system-level affects.

Enable and Disable

The RS7LSX102 has an OE pin input that is used to disable the device by setting the OE pin low, which places all I/Os in the Hi-Z state. The disable time (t_{dis}) indicates the delay between the time when the OE pin goes low and when the outputs actually get disabled (Hi-Z). The enable time (t_{en}) indicates the amount of time the design must allow for the one-shot circuitry to become operational after the OE pin goes high.

Pull-up or Pull-down Resistors on I/O Lines

The RS7LSX102 has the smart pull-up resistors dynamically change value based on whether a low or a high is being passed through the I/O line. Each A-port I/O has a pull-up resistor (RPUA) to VCCA and each B-port I/O has a pull-up resistor (RPUB) to VCCB. RPUA and RPUB have a value of 40 k Ω when the output is driving low. RPUA and RPUB have a value of 4 k Ω when the output is driving high. RPUA and RPUB are disabled when OE = Low. This feature provides lower static power consumption (when the I/Os are passing a low), and supports lower VOL values for the same size pass-gate transistor, and helps improve simultaneous switching performance.

Device Functional Modes

The RS7LSX102 device has two functional modes, enabled and disabled. To disable the device set the OE pin input low, which places all I/Os in a high impedance state. Setting the OE pin input high enables the device.

Application Information

Figure 10 Application Circuit

Design Requirements

To begin the design process, determine the following:

Use the supply voltage of the device that is driving the RS7LSX102 device to determine the input and output voltage range. For a valid logic high the value must exceed the V_{IH} of the input port. For a valid logic low the value must be less than the V_{IL} of the input port.

The RS7LSX102 device has smart internal pull-up resistors. The max data rate under open-drain mode is 1.2Mbps. If a higher data rate is required, 10 k Ω pull-up resistors can be added on external I/Os.

External pull-up resistors can be added to reduce the total RC of a signal trace if necessary. An external pull-down resistor decreases the output V_{OH} and V_{OL} . Use Equation 1 to calculate the V_{OH} as a result of an external pull-down resistor.

$$V_{OH} = V_{CCX} \times R_{PD} / (R_{PD} + 4 \text{ k}\Omega)$$

Power Supply Recommendations

During operation, ensure that $V_{CCA} \leq V_{CCB}$ at all times. The sequencing of each power supply will not damage the device during the power up operation, so either power supply can be ramped up first. The output-enable (OE) input circuit is designed so that it is supplied by V_{CCA} and when the (OE) input is low, all outputs are placed in the high-impedance state. To ensure the high-impedance state of the outputs during power up or power down, the OE input pin must be tied to GND through a pull-down resistor and must not be enabled until V_{CCA} and V_{CCB} are fully ramped and stable. The minimum value of the pull-down resistor to ground is determined by the current-sourcing capability of the driver.

**Layout Guidelines**

To ensure reliability of the device, following common printed-circuit board layout guidelines is recommended.

Bypass capacitors should be used on power supplies. Place the capacitors as close as possible to the VCCA, VCCB pin and GND pin.

Short trace lengths should be used to avoid excessive loading.

PCB signal trace-lengths must be kept short enough so that the round-trip delay of any reflection is less than the one-shot duration, approximately 15 ns, ensuring that any reflection encounters low impedance at the source driver.
