

Features

- 4 Low-power HCSL (LP-HCSL) outputs
- Integrated terminations eliminate up to 4 resistors per output pair
- Dedicated OE# pins support PCIe CLKREQ# function
- Selectable PLL bandwidths minimizes jitter peaking in cascaded PLL topologies
- Hardware/SMBus control of PLL and bypass modes
- Spread spectrum compatible
- 100MHz and 133.33MHz PLL mode
- 1.8V/3.3V operation voltage
- TQFN-32L-5x5mm

Applications

- SSD, Micro Server, WLAN Access points
- Cloud/High-performance Computing
- PCIe switch

Description

The RS2CB2314 is a 1.8V/3.3V ultra-high performance zero delay and fanout buffers of RSM' full featured PCIe family support PCIe Gen7. It has integrated output terminations which can provide $Z_o = 100\Omega$ or 85Ω for direct connection for 100Ω or 85Ω transmission lines. The device has 4 output enables for clock management support PCIe CLKREQ# function.

The family meets all published QPI/UPI, DB2000Q, DB1200ZL and PCIe Gen1-7 jitter specifications. with each output having an OE# pin to support the PCIe CLKREQ# function for low power states.

Key Specifications

- **Fanout Buffer Mode additive phase jitter:**
 - PCIe Gen7 CC, UPI > 20Gb/s < 10fs RMS
 - DB2000Q additive jitter < 39fs RMS
 - QPI/UPI 11.4GB/s < 40fs RMS
 - IF-UPI additive jitter < 70fs RMS
- **ZDB Mode phase jitter:**
 - PCIe Gen7 CC, UPI > 20Gb/s < 20fs RMS
 - QPI/UPI 11.4GB/s < 120fs RMS
 - IF-UPI additive jitter < 130fs RMS
 - Cycle-to-cycle jitter < 50ps
 - Output-to-output skew < 50ps

Ordering Information

Part Number	Package	Description	Differential Output Impedance (Ω)	Operation Temperature ($^{\circ}\text{C}$)
RS2CB2314ZH	TQFN-32L	5mmx5mmx0.75mm 0.5mm pitch	85	-40~85
RS2CB2314-100ZH	TQFN-32L	5mmx5mmx0.75mm 0.5mm pitch	100	-40~85

Pin Descriptions

No.	PIN NAME	TYPE	DESCRIPTION
1	CKPWRGD_PD#	IN	Input notifies device to sample latched inputs and start up on first high assertion. Low enters Power Down Mode, subsequent high assertions exit Power Down Mode. This pin has internal pull-up resistor.
3	CLK_IN	IN	True Input for differential reference clock.
4	CLK_IN#	IN	Complementary Input for differential reference clock.
5	SADR_tri	IN	SMBus address bit. This is a tri-level input that works in conjunction with other SADR pins, if present, to decode SMBus Addresses. It has an internal pull down resistor. See the SMBus Addresses table.
6	SDATA	I/O	Data pin for SMBus circuitry, 3.3V tolerant.
7	SCLK	IN	Clock pin of SMBus circuitry, 3.3V tolerant.
8	FBOUT_NC#	DNC	Complement clock of differential feedback. The feedback output and feedback input are connected internally on this pin. Do not connect anything to this pin.
9	FBOUT_NC	DNC	True clock of differential feedback. The feedback output and feedback input are connected internally on this pin. Do not connect anything to this pin.
13	DIF0	OUT	Differential true clock output
14	DIF0#	OUT	Differential Complementary clock output
15	OE0#	IN	Active low input for enabling DIF pair 0. This pin has an internal pull-down. 1 =disable outputs, 0 = enable outputs
18	OE1#	IN	Active low input for enabling DIF pair 1. This pin has an internal pull-down. 1 =disable outputs, 0 = enable outputs
19	DIF1	OUT	Differential true clock output
20	DIF1#	OUT	Differential Complementary clock output
22	DIF2	OUT	Differential true clock output
23	DIF2#	OUT	Differential Complementary clock output
24	OE2#	IN	Active low input for enabling DIF pair 2. This pin has an internal pull-down. 1 =disable outputs, 0 = enable outputs
26	OE3#	IN	Active low input for enabling DIF pair 3. This pin has an internal pull-down. 1 =disable outputs, 0 = enable outputs
27	DIF3	OUT	Differential true clock output
28	DIF3#	OUT	Differential Complementary clock output
32	HIBW_BYPM_LOBW#	LATCHED IN	Trilevel input to select High BW, Bypass or Low BW mode. See PLL Operating Mode Table for Details.
2	VDDR	PWR	1.8/3.3V power for differential input clock (receiver). This VDD should be treated as an Analog power rail and filtered appropriately.

No.	PIN NAME	TYPE	DESCRIPTION
31	VDDA	PWR	power for the PLL core.
12,16,21 25,29	VDD	PWR	Power supply for differential outputs
10,11,17, 30	NC		No connection
33	GND	GND	Connect EPAD to ground

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage. These ratings, which are standard values for commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS	NOTES
Supply Voltage	VDDxx	Applies to VDD, VDDA and VDDR	-0.5	-	3.63	V	1,2
Input Low Voltage	V _{IL}		GND-0.5	-	-	V	1
Input High Voltage	V _{IH}	Except for SMBus interface.	-0.5	-	V _{DD} +0.5V		1, 3
Input High Voltage	V _{IH}	SMBus clock and data pins			3.9V	V	1
Storage Temperature	T _s		-65		150	°C	1
Junction Temperature	T _j				125	°C	1
Input ESD protection	ESD	Human Body Model	2000			V	1

1. Confirmed by design and characterization, not 100% tested in production.
2. Operation under these conditions is neither implied nor guaranteed.
3. Not to exceed 3.9V.

Thermal Specifications

Trise	t _R	Rise time of single-ended control inputs			5	ns	2
SMBus Input Low Voltage	V _{ILSMB}	VDD _{SMB} = 3.3V, see note 4 for VDD _{SMB} < 3.3V			0.6	V	
SMBus Input High Voltage	V _{IHSMB}	VDD _{SMB} = 3.3V, see note 5 for VDD _{SMB} < 3.3V	1.5		3.6	V	4
SMBus Output Low Voltage	V _{OL_{SMB}}	@ IPULLUP			0.4	V	
SMBus Sink Current	I _{PULLUP}	@ VOL	4			mA	

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS	NOTES
Nominal Bus Voltage	V_{DDSMB}	Bus Voltage	1.7		3.6	V	
SCLK/SDATA Rise Time	t_{RSMB}	(Max VIL - 0.15) to (Min VIH + 0.15)			1000	ns	1
SCLK/SDATA Fall Time	t_{FSMB}	(Min VIH + 0.15) to (Max VIL - 0.15)			300	ns	1
SMBus Frequency	f_{MAXSMB}	Maximum SMBus operating frequency			400	kHz	6

1. Guaranteed by design and characterization, not 100% tested in production.
2. Control input must be monotonic from 20% to 80% of input swing.
3. Time from de-assertion until outputs are > 200 mV.
4. For $V_{DDSMB} < 3.3V$, $VIHSMB > = 0.8 \times V_{DDSMB}$.
5. CLK_IN input.
6. The differential input clock must be running for the SMBus to be active.

Current Consumption

TA = TAMB, Supply Voltages per normal operation conditions, See Test Loads for Loading Conditions

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Operating Supply Current	I_{DDA}	V_{DDA} , PLL Mode at 100MHz. [1]	-	37	45	mA
		V_{DDA} , Fanout Buffer Mode at 100MHz. [1]	-	4	5	mA
	I_{DD}	All other V_{DD} pins at 100MHz.	-	60	68	mA
Power Down Current	I_{DDAPD}	V_{DDA} , CKPWRGD_PD# = 0. [1]	-	3	4	mA
	I_{DDPD}	All other V_{DD} pins, CKPWRGD_PD# = 0.	-	1	2	mA

1. Includes V_{DDR} .

Low Power HCSL Outputs

TA = TAMB, Supply Voltages per normal operation conditions, See Test Loads for Loading Conditions

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	Specification Limits	UNITS
Slew Rate [1][2][3]	dV/dt	Scope averaging on.	2	3.1	4.3	1–4.5	V/ns
Slew Rate Matching [1][4][5]	Δ dV/dt	Single-ended measurement.	-	7.1	20	20	%
Maximum Voltage [5][6]	V _{max}	Measurement on single-ended signal using absolute value (scope averaging off).	700	787	850	150	mV
Minimum Voltage [5][6]	V _{min}		-150	-44	150	-300	
Crossing Voltage (abs) [1][5][7]	V _{cross_abs}	Scope averaging off.	300	369	450	250–550	mV
Crossing Voltage (var) [1][5][8]	Δ -V _{cross}	Scope averaging off.	-	19	50	140	mV

1. Confirmed by design and characterization, not 100% tested in production
2. Measured from differential waveform.
3. Slew rate is measured through the Vswing voltage range centered around differential 0 V. This results in a ± 150 mV window around differential 0V.
4. Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a ± 75 mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.
5. At default SMBus settings.
6. Includes previously separate values of +300mV overshoot and -300mV of undershoot.
7. Vcross is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).
8. The total variation of all Vcross measurements in any particular system. Note that this is a subset of Vcross_min/max (Vcross absolute) allowed. The intent is to limit Vcross induced modulation by setting Δ -Vcross to be smaller than Vcross absolute.

Output Duty Cycle, Jitter, Skew and PLL

TA = TAMB, Supply Voltages per normal operation conditions, See Test Loads for Loading Conditions

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS	NOTES
PLL Bandwidth	BW	-3dB point in High BW Mode	2	2.7	4	MHz	1,5
		-3dB point in Low BW Mode	1	1.4	2	MHz	1,5
PLL Jitter Peaking	t _{JPEAK}	Peak Pass band Gain		1.1	2	dB	1
Duty Cycle	t _{DC}	Measured differentially, PLL Mode	45	50.1	55	%	1
Duty Cycle Distortion	t _{DCD}	Measured differentially, Bypass Mode @100MHz	-1	0.03	1	%	1,3
Skew, Input to Output	t _{pdBYP}	Bypass Mode, V _T = 50%	2000	2500	2800	ps	1
	t _{pdPLL}	PLL Mode V _T = 50%	-100	-4	100	ps	1,4
Skew, Output to Output	t _{sk3}	V _T = 50%		39	50	ps	1,4
Jitter, Cycle to cycle	t _{jyc-cyc}	PLL mode		14	50	ps	1,2
		Additive Jitter in Bypass Mode		0.10	25	ps	1,2

1. Guaranteed by design and characterization, not 100% tested in production.
2. Measured from differential waveform
3. Duty cycle distortion is the difference in duty cycle between the output and the input clock when the device is operated in bypass mode.
4. All outputs at default slew rate
5. The MIN/TYP/MAX values of each BW setting track each other, i.e., Low BW MAX will never occur with Hi BW MIN.

PCIe Phase Jitter – ZDB Mode

1. The Refclk jitter is measured after applying the filter functions found in PCI Express Base Specification 7.0, Revision 1.0. See the [Test Loads](#) section of the data sheet for the exact measurement setup. The worst case results for each data rate are summarized in this table. Equipment noise is removed from all results.
2. Jitter measurements shall be made with a capture of at least 100,000 clock cycles captured by a real-time oscilloscope (RTO) with a sample rate of 20 GS/s or greater. Broadband oscilloscope noise must be minimized in the measurement. The measured PP jitter is used (no extrapolation) for RTO measurements. Alternately, jitter measurements may be used with a Phase Noise Analyzer (PNA) extending (flat) and integrating and folding the frequency content up to an offset from the carrier frequency of at least 200MHz (at 300MHz absolute frequency) below the Nyquist

frequency. For PNA measurements for the 2.5 GT/s data rate, the RMS jitter is converted to peak-to-peak jitter using a multiplication factor of 8.83. In the case where real-time oscilloscope and PNA measurements have both been done and produce different results, the RTO result must be used.

3. SSC spurs from the fundamental and harmonics are removed up to a cutoff frequency of 2 MHz taking care to minimize removal of any non-SSC content.
4. Note that 0.7ps RMS is to be used in channel simulations to account for additional noise in a real system.
5. Note that 0.25ps RMS is to be used in channel simulations to account for additional noise in a real system.
6. This specification also applied to UPI data rates > 20Gb/s.
7. The PCI Express Base Specification 7.0, Revision 1.0 provides the filters necessary to calculate SRIS jitter values, however, it does not provide specification limits, hence the n/a in the Limit column. SRIS values are informative only. In general, a clock operating in an SRIS system must be twice as good as a clock operating in a Common Clock system. For RMS values, twice as good is equivalent to dividing the CC value by $\sqrt{2}$. An additional consideration is the value for which to divide by $\sqrt{2}$. The conservative approach is to divide the ref clock jitter limit, and the case can be made for dividing the channel simulation values by $\sqrt{2}$, if the ref clock is close to the Tx clock input. An example for Gen4 is as follows. A "rule-of-thumb" SRIS limit would be either $0.5\text{ps RMS}/\sqrt{2} = 0.35\text{ps RMS}$ if the clock chip is far from the clock input, or $0.7\text{ps RMS}/\sqrt{2} = 0.5\text{ps RMS}$ if the clock chip is near the clock input.

Additive PCIe Phase Jitter – Fanout Mode

- The Refclk jitter is measured after applying the filter functions found in PCI Express Base Specification 7.0, Revision 1.0. See the [Test Loads](#) section of the data sheet for the exact measurement setup. The total Ref Clk jitter limits for each data rate are listed for convenience. The worst case results for each data rate are summarized in this table. Equipment noise is removed from all results.
- Jitter measurements shall be made with a capture of at least 100,000 clock cycles captured by a real-time oscilloscope (RTO) with a sample rate of 20 GS/s or greater. Broadband oscilloscope noise must be minimized in the measurement. The measured PP jitter is used (no extrapolation) for RTO measurements. Alternately, jitter measurements may be used with a Phase Noise Analyzer (PNA) extending (flat) and integrating and folding the frequency content up to an offset from the carrier frequency of at least 200MHz (at 300MHz absolute frequency) below the Nyquist frequency. For PNA measurements for the 2.5 GT/s data rate, the RMS jitter is converted to peak-to-peak jitter using a multiplication factor of 8.83. In the case where real-time oscilloscope and PNA measurements have both been done and produce different results, the RTO result must be used.
- SSC spurs from the fundamental and harmonics are removed up to a cutoff frequency of 2 MHz taking care to minimize removal of any non-SSC content.
- Note that 0.7ps RMS is to be used in channel simulations to account for additional noise in a real system.
- Note that 0.25ps RMS is to be used in channel simulations to account for additional noise in a real system.
- This specification also applied to UPI data rates > 20Gb/s.
- The PCI Express Base Specification 7.0, Revision 1.0 provides the filters necessary to calculate SRIS jitter values, however, it does not provide specification limits, hence the n/a in the Limit column. SRIS values are informative only. In general, a clock operating in an SRIS system must be twice as good as a clock operating in a Common Clock system. For RMS values, twice as good is equivalent to dividing the CC value by $\sqrt{2}$. An additional consideration is the value for which to divide by $\sqrt{2}$. The conservative approach is to divide the ref clock jitter limit, and the case can be made for dividing the channel simulation values by $\sqrt{2}$, if the ref clock is close to the Tx clock input. An example for Gen4 is as follows. A “rule-of-thumb” SRIS limit would be either $0.5ps\ RMS/\sqrt{2} = 0.35ps\ RMS$ if the clock chip is far from the clock input, or $0.7ps\ RMS/\sqrt{2} = 0.5ps\ RMS$ if the clock chip is near the clock input.
- Additive jitter for RMS values is calculated by solving for “b” where $b = \sqrt{c^2 - a^2}$ and “a” is rms input jitter and “c” is rms output jitter.

Filtered Phase Jitter Parameters – QPI/UPI, IF-UPI and DB2000Q

T_{AMB} = over the specified operating range. Supply voltages per normal operation conditions; see [Test Loads](#) for loading conditions.

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	Limits	UNITS
Additive Phase Jitter, Fanout Mode	t _{jphIF-UPI}	IF-UPI, Lo-BW ZDB Mode [1][2][3]	-	0.10	0.13	1	ps (RMS)
		IF-UPI, Hi-BW ZDB Mode [1][2][3]	-	0.17	0.20	1	ps (RMS)
		IF-UPI, Fanout Mode [1][2][3]	-	0.06	0.07	1	ps (RMS)
	t _{jphDB2000Q}	DB2000Q, Fanout Mode [1][4]	-	22	25	80	fs (RMS)

- Applies to all differential outputs, guaranteed by design and characterization. See [Test Loads](#) for measurement setup details. Legacy QPI and UPI specifications (100MHz or 133.33MHz clocking with data rates of 4.8Gb/s to 11.4Gb/s are automatically met in all operating modes when the PCI Gen5 CC requirements are met. See [Table 12](#) and [Table 13](#).
- For RMS values, additive jitter is calculated by solving for “b” where $b = \sqrt{(c^2 - a^2)}$, “a” is rms input jitter and “c” is rms total jitter.
- Calculated from phase noise analyzer with Intel-specified brick-wall filter applied. This is an additive jitter specification regardless of buffer operating mode. The enhanced 9ZXL devices meet this specification in all operating modes.
- Calculated from Intel-supplied clock jitter tool.

Phase Jitter Parameters – 12kHz to 20MHz

T_{AMB} = over the specified operating range. Supply voltages per normal operation conditions; see [Test Loads](#) for loading conditions.

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	Limits	UNITS
12kHz–20MHz Additive Phase Jitter, Fanout Buffer Mode [1][2][3]	t _{jph12k-20MFOB}	Fanout Buffer Mode, SSC OFF, 100MHz	-	102	125	N/A	fs (RMS)

- Applies to all differential outputs, guaranteed by design and characterization. See [Test Loads](#) for measurement setup details.
- 12kHz to 20MHz brick wall filter.
- For RMS values, additive jitter is calculated by solving for “b” where $b = \sqrt{(c^2 - a^2)}$, “a” is rms input jitter and “c” is rms total jitter.

SMBus Interface

Write Sequence

- Controller (host) sends a start bit
- Controller (host) sends the write address
- RS2CB2314 clock will **acknowledge**
- Controller (host) sends the beginning byte Location= N
- RS2CB2314 clock will **acknowledge**
- Controller (host) sends the byte count = X
- RS2CB2314 clock will **acknowledge**
- Controller (host) starts sending Byte **N through Byte N+X-1**
- RS2CB2314 clock will **acknowledge** each byte one at a time
- Controller (host) sends a stop bit

Index Block Write Operation			
Controller (Host)		RS2CB2314 (Slave/Receiver)	
T	start bit		
Slave Address			
WR	Write		
			ACK

P	stop bit		

Read Sequence

- Controller (host) will send a start bit
- Controller (host) sends the write address
- RS2CB2314 clock will **acknowledge**
- Controller (host) sends the beginning byte Location= N
- RS2CB2314 clock will **acknowledge**
- Controller (host) will send a separate start bit
- Controller (host) sends the read address
- RS2CB2314 clock will **acknowledge**
- RS2CB2314 clock will send the data byte count = X
- RS2CB2314 clock sends **Byte N+X-1**
- RS2CB2314 clock sends **Byte L through Byte X (if X(H) was written to Byte 7)**
- Controller (host) will need to acknowledge each byte
- Controller (host) will send a not acknowledge bit
- Controller (host) will send a stop bit

Index Block Read Operation			
Controller (Host)			RS2CB2314 (Slave/Receiver)

RS2CB2314

4-Output Zero Delay Buffers for PCIe Gen7 and UPI

Package Information

TQFN-32L

**Note:**

1. All dimensions are in mm. Angles in degrees.
2. Dimensions exclude burrs, mold flash or protrusions.
3. Refer Jeduc MO-220
4. Thermal pad soldering area.
5. Depending on the method of lead termination at the edge of the package.
6. Recommended land pattern is for reference only.
7. Mesh stencil is recommended.

TQFN5X5-32L (ZH32) POD Rev.0
